Lab work

In this tutorial you will have the opportunity to manipulate the concepts of Data Warehouse on a grocery store application (sales data). The project is implemented in Access, an easy-to-use tool for creating business applications. You will be able to consult several relational tables that has been created for this example and you will learn about the structure of this particular Data Warehouse (relationship diagram and content of each dimension).

In order to summarize the large quantity of data in the Data Warehouse, you will learn how to use the pivot table function in Excel. The pivot table is a very useful data processing tool used to extract the significance from a large, detailed data set in a quick and easy way.
